

My idea is building a student online book system. The purpose of this idea is building a information page for each student's parents, and it can give out some information like class schedule, grade book and personal information. The audience will be the parents and maybe some of the students themselves.

The process is using non-linear design, user can use the button on the top to choose which students to choose, and they can change to any students they like. Also, the page for each students are link/change with key button, and user can change it with their button.

The main two students: press 1 & 2 to change the students.

The different separate states: Home page/ Profile page / Schedule page / Grade page

This interaction design using the button and key to interact with the audience, which is very familiar in today's web designing idea.
